```

Optimizer available at <https://www.gerad.ca/en/software/nomad/>

Add /opt/nomad to Linux \$PATH

Experiment "Stirred tank"

The bash script should run everything.

Experiment "Lotka Volterra"

The bash script should run everything.

Experiment "ABM model"

The bash script explains the procedure.

For the optimization, two terminal windows should be opened simultaneously.

The software has a set of command line options, not really meant for easiness of use (sorry): consider it the kind of artifact used in lab, *with no polished interface*. At times, code was modified to log information, save/store something, so there's some duct tape and wd-40 here and there.

Compile simply with "gcc sw.cpp -o sim" : no fancy cmake, no black magic.

Generating the plot of the contamination tree is tricky, requiring dot, editing, and patience; this process is not included in this package.
